

## POLLINATOR GARDEN

Complete Habitat And Food Garden  
For Local Bees And Butterflies

### Pollinator Garden

**What is a Pollinator Garden?** A mix of 38 native wildflowers from Southern Ontario, chosen to provide food for pollinator insect species.

**Why plant a Pollinator Garden?** On a global level the populations of pollinator species have reduced dramatically due to loss of habitat, herbicides, pesticides, invasive species, diseases and parasites. By planting a pollinator garden, you will be providing important habitat and food sources for pollinator insect species.

Renaissance style landscaping in North America has replaced important natural habitat with ornamental species that are non-native to our ecosystems. Most of these species have evolved outside of the formed relationships native plants and animals have. Thus, these non-native species do not provide the necessary food and habitat to continue healthy natural systems.

Make your backyard into a healthy habitat for pollinators!!!

**Native Flower species may include:** boneset, joe pyeweed, dense blazing star, wild bergamot, cardinal flower, great blue lobelia, black eyed susan, new england aster, showy tick trefoil, canadian anemone, bigleaf wood aster, virginia mountain mint, common milkweed, swamp milkweed, butterfly milkweed.

**Specifications:** Contains a 21"x11" tray with a 38 plug insert. All plants are second year and vernalized native wildflowers.
